

Book Recommendation and Review Platform Documentation

Project Overview

This project is a simple web application that allows users to add book recommendations and reviews. The entire project is built using only HTML, CSS, and JavaScript and runs completely in the browser, so there is no backend server involved. All interactions, such as entering a book title and its review and then displaying them, are handled on the client side.

Project Structure

- index.html: The main HTML file that provides the structure of the user interface.
- style.css: Contains styling rules to make the interface visually appealing.
- script.js: Implements the functionality, including capturing user input, validating it, and updating the list of reviews dynamically.

Setup and Running the Project

1. Open your project folder in Codespaces.
2. Locate the index.html file.
3. Open it in the preview pane or use Live Server.
4. Enter a book title and review, then submit.

Features and Functionality

- User Input: Fields for a book title and a review.
- Validation: Ensures both fields are filled before submission.
- Dynamic Updates: Reviews appear instantly without page refresh.
- Simple UI: Focused on clarity and ease of use.

Debugging and Common Issues

If errors occur, ensure files are correctly linked. In Codespaces, if port issues arise, use the preview or Live Server extension. Note that data is not persistent after page refresh.

Future Improvements

- Add local storage for persistence.
- Enhance UI with styling and animations.
- Implement editing and deleting of reviews.
